

PROJECT	Credit Card Approval Prediction	TEAM	AI/ML Program
DOCUMENT	Brainstorming & Idea Prioritization	DATE	July 2026

Brainstorming & Idea Prioritization

The team held a brainstorming session to identify a real-world problem in the banking and financial sector that could be addressed using machine learning. Several problem areas were discussed before finalizing the project direction.

Ideas Considered

- Automating credit card approval decisions using applicant financial and demographic data
- Predicting loan default risk for personal loans
- Fraud detection in card transactions
- Customer churn prediction for banking services

Prioritization Criteria

- Availability of a clean, well-documented public dataset
- Real-world relevance to the banking and finance industry
- Feasibility within the project timeline using classification algorithms
- Opportunity to compare multiple ML algorithms (Logistic Regression, Decision Tree, Random Forest, XGBoost)

Selected Idea

Credit Card Approval Prediction was selected as the final idea. It offered a well-structured, publicly available Kaggle dataset, clear business relevance (reducing manual review time and human error in credit decisions), and enough complexity to apply a full classification pipeline end-to-end, from raw data to a deployed web application.
