Define Problem Statement

Problem Statement

Banks and financial institutions receive thousands of credit card applications every day. A significant portion of these are rejected due to factors such as high existing loan balances, insufficient income levels, or excessive credit inquiries. Manually reviewing each application is time-consuming and highly prone to human error, making it inefficient at scale.

Why This Matters

- Manual review delays application processing for genuine customers
- Human error can lead to inconsistent approval decisions
- High-risk applicants may be approved due to reviewer oversight
- Low-risk applicants may be unnecessarily rejected

Objective

To build a machine learning system that automates the credit card approval decision by learning patterns from historical applicant data (financial, demographic, and credit history), and to expose this model through a web application so bank staff or applicants can receive an instant, data-driven prediction of approval likelihood.
